

1. get Docstrings:- using **doc** and inspect ex:- `className.doc` , `className.funcName.doc`

OOPS

Oops:- Class

- class is a collection of objects/attributes and method.

Get Class Variables/attributes

- Using `getattr()` function
- Using Object

```
class Student:
    name = 'mohit saxena'
    roll_no = '12845678'

print(Student.name)      # mohit saxena
print(Student.roll_no)   # 12845678

# using getattr() function
name = getattr(Student, 'name')
print(name)

# Using object
obj= Student()
print(obj.name) # mohit saxena
```

Set/Change values for class variables

- set the value **using class**
- using **setattr()** built-in function
- using **object**

```
class Student:
    name = 'mohit saxena'
    roll_no = 12845678

# set the value using class
Student.roll_no = 10
print(Student.roll_no)    # output:- 10

# using setattr() built-in function
setattr(Student, 'roll_no', 10)
print(Student.roll_no)    # output:- 10

# using **object**
obj= Student()
```

```
obj.name = 'saxena mohit'
print(obj.name) # Output:- saxena mohit
```

Delete class variables

- using **delattr()** function:
- using del keyword

```
class Student:
    name = 'mohit saxena'
    roll_no = '12845678'

print(Student.name)      # mohit saxena
print(Student.roll_no)   # 12845678

# using **delattr()** function:
delattr(Student, 'roll_no') # Output:- AttributeError: type object 'Student' has
no attribute 'roll_no'

# using del keyword
del Student.roll_no
print(Student.roll_no)   # Output:- AttributeError: type object 'Student' has no
attribute 'roll_no'
```

Object
